

**Homework solutions: Section 2.8 #31-36**

31. Suppose  $F$  is a  $5 \times 5$  matrix whose column space is not equal to  $\mathbb{R}^5$ . What can you say about  $\text{Nul } F$ ?

*Start your explanations with the assumptions (the suppose part). Since the column space of  $F$  is not equal to  $\mathbb{R}^5$ ,  $F$  does not have a pivot in every row. Since  $F$  is square, we know  $F$  also does not have a pivot in every column. This means that the homogeneous equation  $F\mathbf{x} = \mathbf{0}$  has non-trivial solutions. Since  $\text{Nul } F$  is the solution set to the homogeneous equation, we can deduce that  $\text{Nul } F$  contains nonzero vectors, or in other words,  $\text{Nul } F \neq \{\mathbf{0}\}$ .*

32. If  $R$  is a  $6 \times 6$  matrix and  $\text{Nul } R$  is not the zero subspace, what can you say about  $\text{Col } R$ ?

*Start your explanation with the assumptions (the if part). Since  $\text{Nul } R$  is not the zero subspace, we know that the homogeneous equation  $R\mathbf{x} = \mathbf{0}$  has nontrivial solutions. This means that  $R$  does not have a pivot in every column. Since  $R$  is square, this also means that  $R$  does not have a pivot in every row, so the columns of  $R$  do not span all of  $\mathbb{R}^6$ . Thus  $\text{Col } R$  is not equal to  $\mathbb{R}^6$ .*

33. If  $Q$  is a  $4 \times 4$  matrix and  $\text{Col } Q = \mathbb{R}^4$ , what can you say about solutions of equations of the form  $Q\mathbf{x} = \mathbf{b}$  for  $\mathbf{b}$  in  $\mathbb{R}^4$ ?

*Start with the assumptions (the if part). Since  $\text{Col } Q = \mathbb{R}^4$ , the span of the columns of  $Q$  is all of  $\mathbb{R}^4$ , so  $Q$  has a pivot in every row. Furthermore, since  $Q$  is square,  $Q$  also has a pivot in every column. This means that  $Q\mathbf{x} = \mathbf{b}$  has a unique solution for all  $\mathbf{b}$  in  $\mathbb{R}^4$ . Keep straight in your mind that a pivot in every row means the solution always exists, and a pivot in every column means that when there is a solution, that solution is unique.*

34. If  $P$  is a  $5 \times 5$  matrix and  $\text{Nul } P$  is the zero subspace, what can you say about solutions of the equations of the form  $P\mathbf{x} = \mathbf{b}$  for  $\mathbf{b}$  in  $\mathbb{R}^5$ ?

*Start with the assumptions (the if part). Since  $\text{Nul } P$  is the zero subspace, the homogeneous equation  $P\mathbf{x} = \mathbf{0}$  has only the trivial solution, which means that  $P$  has a pivot position in every column. Since  $P$  is square,  $P$  also has a pivot in every row. Thus  $P\mathbf{x} = \mathbf{b}$  has a unique solution for every  $\mathbf{b}$  in  $\mathbb{R}^5$ . Keep straight in your mind that a pivot in*

*every row means the solution always exists, and a pivot in every column means when there is a solution, that solution is unique.*

35. What can you say about  $\text{Nul } B$  when  $B$  is a  $5 \times 4$  matrix with linearly independent columns?

*Since  $B$  has linearly independent columns,  $B$  has a pivot in every column. This means that the homogeneous equation  $B\mathbf{x} = \mathbf{0}$  has only the trivial solution, so  $\text{Nul } B = \{\mathbf{0}\}$  where  $\mathbf{0}$  denotes the zero vector in  $\mathbb{R}^4$ .*

36. What can you say about the shape of an  $m \times n$  matrix  $A$  when the columns of  $A$  form a basis for  $\mathbb{R}^m$ ?

*If the columns of  $A$  form a basis for  $\mathbb{R}^m$ , the columns of  $A$  must span  $\mathbb{R}^m$  (so  $A$  must have a pivot in every row), and the columns must be linearly independent (so  $A$  must have a pivot in every column). Thus in this case  $m = n$ . Thus  $A$  is a square matrix.*
