I. <u>PRODUCT COSTING</u>: There are two fundamental methods of product costing:

A. Job Order Costing

- 1. <u>Cost Center</u>: The Job in production (an identifiable product)
 - a. DM and DL are directly traceable to the job and overhead is to be allocated based on an "application rate";
 - b. The units of production are distinct and identifiable and customers are willing to pay differential prices for differing products due to those unique characteristics.
- 2. <u>Cost per unit</u> = DM + DL + Applied OH = <u>Normal Costs</u>

B. Process Costing

- 1. <u>Cost Center</u>: The production run or product line (units of output are not separately distinguishable)
 - a. No costs are directly traceable to specific products or units of output.
 - b. Production costs are assigned on an average basis and overhead is assigned on some "acceptable" basis, usually based on units produced.
- 2. Cost per unit = total material + total labor + total OH

number of units produced

- C. Factors Used to Choose Which System is Appropriate for a Given Application
 - 1. <u>Nature of the production</u>:
 - a. If labor and material are not directly traceable to a given unit of production, process costing must be used
 - 2. <u>Nature of the end product</u>:

a. If customers are not willing to pay a differential price for alternative products, the added cost of a product costing system is not cost effective

II. Job Order Costing

A. Overhead (OH) and Job Order Costing

1. Overhead must be applied to (absorbed by) on some reasonable basis because it cannot be directly traced to the production. Job order costing systems distinguish between three types of overhead:

- a. Budgeted OH: The estimated OH at the beginning of the accounting cycle
- b. Actual OH: The actual OH charges as recorded in the OH control account
- c. <u>Applied OH</u>: The OH applied to the job during the period based on the application rate and budgeted OH numbers agreed upon at the beginning of the accounting cycle
- 2. In any given period the overhead applied to the production will differ from the actual overhead incurred on the job. The amount of over/under applied overhead must be used to adjust the COS account at the end of the accounting cycle.
 - a. Add under-applied OH to COS
 - b. Deduct over-applied OH to COS

III. <u>The uses of Costing Systems</u>: Internal accounting systems have <u>two purposes</u>: decision making (planning and control) and inventory valuation.

Note: The following discussion concentrates on inventory valuation only. The planning and control aspects will be discussed in handout 5-2A

- A. The Problem: How to gather all the data from the various departments.
 - 1. The factors of production, Direct Material (DM), Direct Labor (DL) and Factory Overhead (OH) must be traced through the manufacturing process accurately and **in a timely manner** in order to determine the cost of a product

Factors of production must be traced throughout the manufacturing process

C. Methodology: here are two basic methods of product costing:

1. *Job Order Costing*

- a. <u>Cost Center (Cost Object)</u>: The Job in production (an identifiable product)
 - 1. DM and DL are directly traceable to the job and overhead is to be allocated based on an "application rate";
 - 2. The units of production are distinct and identifiable and customers are willing to pay differential prices for differing products due to

those unique characteristics.

b. Cost per unit = DM + DL + Applied OH = <u>Normal Costs</u>

2. Process Costing

- a. <u>Cost Center (Cost Object)</u>: The production run or product line (units of output are not separately distinguishable; i.e. products like bread, gasoline, spaghetti sauce etc.)
 - 1. No costs are directly traceable to specific products or units of output.
 - 2. Production costs are assigned on an average basis and overhead is assigned on some "acceptable" basis, usually based on units produced.
- b. Cost per unit = <u>total material + total labor + total OH</u>
 - number of units produced
- c. <u>Equivalent units of production</u>: Process costing is used in applications in which homogeneous/indistinguishable inputs are combined to produce finished goods. For purposes of inventory costing of homogeneous/indistinguishable products it is useful to assume that ten units that are 50% complete are the same as 5 units 100% complete. This is termed the concept of **equivalent finished units** or **equivalent units (EU)**. Equivalent units must be computed for each factor of production i.e. compute EU for DM, DL and OH.

1. To illustrate the computation of Equivalent units assume the following facts:

		(End	ding WIP)						
	Units Completed Units on Hand		Beginning Inventory		Ending Inventory				
	In Current Period	End	of Period	% Completion		% Completion			
	14,000		2,000						
Direct Materia	l				50%		60%		
Direct Labor					30%		70%		
Manufacturing Overhead			20% 90%						
Equivalent fi	nished units:								
			Completed		%(Beg Inv)	+	%(End Inv)	=	EU
	EU-Direct Material	=	14,000	-	(.5)(2,000)	+	(.6)(2,000)	=	14,200
	EU-Direct Labor	=	14,000	-	(.3)(2,000)	+	(.7)(2,000)	=	14,800
	EU-Overhead	=	14,000	-	(.2)(2,000)	+	(.9)(2,000)	=	15,400

3. Factors Used to Choose Which System is Appropriate for a Given Application

a. <u>Nature of the production</u>:

1. If labor and material are not directly traceable to a given unit of production, process costing must be used

b. <u>Nature of the end product</u>:

1. If customers are not willing to pay a differential price for alternative products, the added cost of a product costing system is not cost effective

II. JOB ORDER COSTING IN MANUFACTURING COMPANIES:

A. Overhead (OH) and Job Order Costing

- 1. Overhead must be applied to (absorbed by) on some reasonable basis because it cannot be directly traced to the production. Job order costing systems distinguish between three types of overhead:
 - a. <u>Budgeted OH</u>: The estimated OH at the beginning of the accounting cycle
 - b. <u>Actual OH</u>: The actual OH charges as recorded in the OH control account
 - c. <u>Applied OH</u>: The OH applied to the job during the period based on the application rate and budgeted OH numbers agreed upon at the beginning of the accounting cycle
- 2. In any given period the overhead applied to the production will differ from the actual overhead incurred on the job. The amount of over/under applied overhead must be used to adjust the COS account at the end of the accounting cycle.
 - a. Add under-applied OH to COS
 - b. Deduct over-applied OH to COS

B. Applying Overhead in Job Order Costing

1. In order to compute the full cost of various inventories prior to the end of the production process and/or prior to the time that the bill for indirect costs has arrived, decision makers must either estimate overhead costs prior to the arrival of bills or wait until the bills have arrived and the information is no longer useful, because it is so late in the planning process. In order to make timely decisions, overhead must be applied to the inventory in some arbitrary manner.

Time ————Note that as time passes, information becomes more accurate but less useful ————>

More Accurate Information

- **NOTE**: *Direct Material* and *Direct Labor* are directly traceable to the cost object; on the other hand, because factory overhead is an indirect cost, an application procedure must be utilized for overhead for two reasons:
 - a. the actual amount of factory overhead is not known and is not directly traceable to the various inventories and
 - b. planners cannot wait until the actual amount of OH is known, because by that time, the time for useful decisions would have past.
- **NOTE:** At this time, we are only concerned with the process of estimating the amount of factory overhead (the overhead application process), in future chapters we will discuss the process of allocating overhead amongst the various inventories. The OH <u>application</u> process relates to the process of estimating the full cost of the cost object; whereas the OH <u>allocation</u> process relates to the process of allocating the various inventories. It is important to make that distinction at an early stage of the learning process.
 - 2. The process of applying overhead is an arbitrary one. Its' goal is to enable planners to compute the full cost of a cost object. The process consist of six steps:
 - a. <u>step one</u>: The budgeted amount of overhead (indirect production costs) expected for the period is estimated. (This is part of the budgeting process);
 - <u>step two</u>: Management determines the **denominator level of activity (sometimes called the allocation base)** based on the type of activity most closely related to overhead for each specific circumstance (typical examples are: DL hours; machine hours; units of production etc.)
 - 1. Objectives in selecting an allocation base:
 - a. should be relatively constant from period to period (may use an annualized rate or average if necessary)b. easy to keep track of
 - c. <u>step three</u>: the budgeted overhead application rate is determined by dividing the budgeted overhead by the appropriate denominator level of activity;

Budgeted application rate

Budgeted Factory Overhead
 Budgeted Denominator Level of Activity

- d. step four: The actual denominator level of activity is determined
- e. step five: Overhead is applied to the cost object by multiplying the actual denominator level of activity by the budged application rate:

Factory Overhead Applied = (Actual Denominator Level of Activity) (Budgeted Application Rate)

Overhead Applied must always be designated as over or under applied.

- F .<u>step six</u>: At the end of the accounting period, the difference between the factory overhead applied in step five must be reconciled with the actual factory overhead incurred. The difference is called over-applied (OH applied is greater than budgeted OH) or under-applied overhead (OH applied is less than budgeted OH).
 - 1. Over-applied OH is credited (a reduction) to cost of goods sold (or allocated between WIP, FG and COS);
 - 2. Under-applied OH is debited (an increase) to cost of goods sold (or allocated between WIP, FG and COS);

Note: On interim financial statements over/under-applied overhead is sometimes carried on the balance sheet and not charged to COS or allocated between COS, WIP of FG inventories; this has the effect of treating the difference between actual cost and actual cost as an unexpired cost (an asset). The rationale is that interim financial statement under/over-applications may be temporal in nature. The final decision on how to treat applied overhead on the interim financial statements is dependent upon management prerogatives and the expected final period results.

NOTE: Several alternative procedures are available for the treatment of Over/Under-applied OH. These procedures will be discussed in future examples. Suffice it to say at this point that direct adjustment to cost of goods sold is common practice unless other methods are denomstrably superior in producing more meaningful data.

Actual amounts of DM and DL plus the applied factory overhead is referred to as the **<u>NORMAL COST</u>** of inventory; The <u>ACTUAL COST</u> of inventory consist of all actual costs incurred but is rarely used in practice because it takes to long to determine the actual amounts of factory overhead.

3. Job Order Costing Journal Entries:

а.	Purchase materials		
	Stores control (actual cost)	60,000	
	Accounts Payable		60,000
b.	Issue supplies and materials for a job and record cost of indirect material used		
	WIP control (actual cost of DM charged to a specific job)	48,000	
	Factory OH Control (not directly traceable to job; allocated to dept and assigned to job).	4,000	
	Stores Control (actual cost of all material used)		52,000
С.	Record Labor Cost		
	WIP control (actual cost of DL charged to a specific job)	39,000	
	Factory OH Control (not directly traceable to job; allocated to dept and assigned to job)	5,000	
	Accrued Payroll (actual cost of all labor used)		44,000

Note: The items of material, labor and other miscellaneous costs charged to Factory OH control are not directly traceable to a specific job. These items are assigned to various departments that are working on various jobs and then assigned by the departments to the jobs. These costs represent the actual costs of these indirect items.

Accrued payroll (actual payroll costs incurred)	44,000	
Cash		44,00
e. Record the Incurrence of Miscellaneous other indirect costs		
Factory OH Control (actual amounts; refer to note in box above for explanation)	18,000	
Accounts payable		11,00
Prepaid insurance		1,00
Accumulated Depreciation		6,00

Example for Type 1: \$30,000,000 = \$1.00 (\$5,250,000) = \$5,250,000 \$30,000,000

** Computed as follows: <u>Application basis</u> x (Over/under-applied OH) Actual Denominator level of activity

Example for Type 1: <u>\$ 5,250,000</u> x (\$500,000) = (\$84,677) \$31,000,000

Requirement 3. OH is applied on the basis of Prime Cost: (Prime Costs = DM + DL)

Operating Data	Type 1	Type 2	Type 3	Type 4	Total
Selling price:	\$15,000,000	\$24,000,000	\$31,000,000	\$20,000,000	\$90,000,000
Direct Labor Cost:					
DM:	\$ 3,500,000	\$ 5,500,000	\$ 8,500,000	\$ 4,500,000	\$22,000,000
DL:	5,250,000	<u>8,250,000</u>	10,250,000	7,250,000	31,000,000
	\$ 8,750,000	\$13,750,000	\$18,750,000	\$11,750,000	\$53,000,000
Overhead Applied:	<u>\$ 5,250,000</u> *	<u>\$ 8,250,000</u> *	<u>\$11,250,000</u> *	<u>\$ 7,050,000</u> *	<u>\$31,800,000</u>
Normal Cost of Inv.:	\$14,000,000	\$22,000,000	\$30,000,000	\$18,800,000	\$84,800,000
Less: over-applied Ol	H: (214,623)**	(337,264)*	* (459,906)**	(288,207)**	(1,300,000)
Cost of goods sold:	\$13,785,377	\$21,622,736	\$29,540,094	\$17,511,793	<u>\$83,500,000</u>
Gross profit:					\$ 6,500,000

- * Computed as follows: <u>Budgeted Overhead</u> = OH Application rate (Actual Denominator Level of Activity) Budgeted Denominator level of activity
 - Example for Type 1: \$30,000,000 = \$.60 (\$8,750,000) = \$5,250,000 \$50,000,000
- ** Computed as follows: <u>Application basis</u> x (Over/under-applied OH) Actual Denominator level of activity
 - Example for Type 1: <u>\$8,750,000</u> x (\$1,300,000) = (\$214,632) \$53,000,000

Requirement 4. OH is applied on the basis of Direct Labor Hours:

Operating Data	Type 1	Type 2	Туре 3	Type 4	Total
Selling price:	\$15,000,000	\$24,000,000	\$31,000,000	\$20,000,000	\$90,000,000
Direct Labor Cost:					
DM:	\$ 3,500,000	\$ 5,500,000	\$ 8,500,000	\$ 4,500,000	\$22,000,000
DL:	5,250,000	8,250,000	10,250,000	7,250,000	31,000,000
	\$ 8,750,000	\$13,750,000	\$18,750,000	\$11,750,000	\$53,000,000
Overhead Applied:	<u>\$ 6,250,000</u> *	<u>\$11,250,000</u> *	<u>\$11,250,000</u> *	<u>\$ 6,250,000</u> *	<u>\$35,000,000</u>
Normal Cost of Inv.:	\$15,000,000	\$25,000,000	\$30,000,000	\$18,000,000	\$88,000,000
Less: over-applied Ol	H: (803,571)*	* (1,446,429)**	*(1,446,429)**	(803,571)**	(4,500,000)
Cost of goods sold:	\$14,196,429	\$23,553,571	\$28,553,571	\$17,196,429	<u>\$83,500,000</u>
Gross profit:			\$ 0	6,500,000	

* Computed as follows: <u>Budgeted Overhead</u> = OH Application rate (Actual Denominator Level of Activity) Budgeted Denominator level of activity

Example for Type 1: $\frac{30,000,000}{12,000}$ = 2,500 per DL hour (2,500) = 6,250,000

** Computed as follows: <u>Application basis</u> x (Over/under-applied OH) Actual Denominator level of activity

Example for Type 1:	<u>2,500</u> x					
	14,000	(\$4,500,000)	= (\$803,57	71)		
Requirement 5. OH is a	pplied on the	basis of Sellin	g Price:			
Operating Data	Type 1	Type 2	Type 3	Type 4	Total	
Selling price: Direct Labor Cost:	\$15,000,000	\$24,000,000	\$31,000,000	\$20,000,000	\$90,000,000	
DM:	\$ 3,500,000	\$ 5,500,000	\$ 8,500,000	\$ 4,500,000	\$22,000,000	
DL:	5,250,000	8,250,000	10,250,000	7,250,000	31,000,000	
	\$ 8,750,000	\$13,750,000	\$18,750,000	\$11,750,000	\$53,000,000	
Overhead Applied:	<u>\$ 5,000,000</u> *	<u>\$ 8,000,000</u> *	<u>\$10,333,333</u> *	<u>\$ 6,666,667</u> *	\$30,000,000	
Normal Cost of Inv.	: \$13,750,000	\$21,750,000	\$29,083,333	\$18,416,667	\$83,000,000	
Add: Under-applied	OH· 83.333 ;	** 133,333 **	172,222	111,112 **	500,000

Managerial Accounting 4-2B Job Order and Process Costing Systems

Long Beach State University

Page 8

Dr. M.D. Chase

II REVIEW QUESTIONS:

- 1. A job-order costing system would be more suitable than an operation costing system for the manufacture of bricks. ΤF
- 2. A process cost system would be less appropriate for the manufacture of bricks than for the construction of brick apartment houses ΤF
- 3. The use of a budgeted annual rate for applying factory overhead would usually produce more accurate costing of products than would the use of an actual annual rate.

ΤF

- 4. The use of an actual annual rate for applying factory overhead cost would usually produce more accurate costing of products than would the use of a budgeted annual rate.
 - ΤF
- 5. Budgeted factory overhead minus actual factory overhead equals over-applied factory overhead. ΤF
- 6. Under-applied or over-applied factory overhead is the difference between the applied factory overhead and the budgeted factory overhead. ΤF
- 7. Actual factory overhead minus under-applied factory overhead equals applied factory overhead. ΤF
- 8. The subsidiary ledger accounts for factory department overhead contain debit entries for actual overhead cost. ΤF
- 9. The typical end-of-year treatment of over-applied factory overhead is to deduct it from cost of goods sold. ΤF
- 10. There was no beginning inventory for a certain month in the Cooking Process of Zebulon Company. During the month, 15,000 units were started, of which all were completed and transferred out except 20%, which were 60% completed. The number of equivalent units produced was 13,200. ΤF
- 11. Examples of products or operations for which a process costing system would probably be appropriate include:
 - (1) aircraft production (3) flour milling
 - (2) building construction (4) book publishing

12. Stores requisitions are used in a job-order costing system as:

- (1) subsidiary ledgers of materials on hand
- (2) media for charging costs to jobs and departments
- (3) part of the subsidiary factory department overhead cost records
- (4) none of the above
- 13. The subsidiary ledger for the factory department overhead control account typically contains entries for:
- (1) budgeted overhead
- (3) actual overhead (2) applied overhead (4) all of the above costs
- 14. In a job-order cost system, factory overhead applied should be:
 - (1) credited to Work in Process
 - (2) credited to Factory Overhead Applied
 - (3) debited to Factory Department Overhead
 - (4) debited to Finished Goods Control
- 15. When direct materials are issued to production departments under a job-order cost system, a credit should be made to:
- (1) Stores
- (3) Job-cost records (4) Factory Overhead
- (2) Work in Process

16. Using an actual rate for applying factory overhead would be preferable to using a budgeted rate, if your overriding concern is:

- (1) accuracy of determination of product costs
- (2) timeliness of determination of product costs
- (3) economy of bookkeeping and accounting
- (4) usefulness to management of product costs

17. Under-applied factory overhead is the excess of:

- (1) budgeted overhead over applied overhead
- (2) actual overhead over applied overhead
- (3) applied overhead over actual overhead
- (4) actual overhead over budgeted overhead

18. The usual year-end treatment of under-applied factory overhead is to:

- (1) debit Cost of Goods Sold
- (2) debit Cost of Goods Sold and appropriate inventory accounts
- (3) credit Cost of Goods Sold
- (4) credit Cost of Goods Sold and appropriate inventory accounts
- 19. The usual end-of-year treatment of over-applied factory overhead is to:
- (1) credit Cost of Goods Sold
- (2) debit Cost of Goods Sold
- (3) debit Cost of Goods Sold and appropriate inventory accounts
- (4) credit Cost of Goods Sold and appropriate inventory accounts
- 20. A normal absorption costing system provides for charging Work in Process with:
- (1) actual direct labor costs and actual factory overhead costs
- (2) applied direct labor costs and actual factory overhead costs
- (3) applied direct labor costs and applied factory overhead costs
- (4) actual direct labor costs and applied factory overhead costs
- 21. Given:

	Case A	Case B				
Budgeted direct-labor hours	400,000 hrs.	600,000 hrs.				
Budgeted factory overhead cost	\$900,000	\$720,000				
Actual direct-labor hours	420,000 hrs.	550,000 hrs.				
Actual factory overhead cost	\$932,000	\$680,000				
Overhead is to be applied on the basis of direct labor hours						

Required: For both case A and B compute the following:

- (a) Budgeted overhead rate
- (b) Applied factory overhead cost
- (c) Amount of under-applied or over-applied factory overhead cost (indicate whether under or over)

- 2. F
